

If your organization uses Adobe cloud storage, you can link content and folders from Experience Manager Assets to any Adobe Workfront object that supports documents.

Link content and folders from Experience Manager Assets with Adobe cloud storage

If your organization uses Adobe cloud storage, you can link content and folders from Experience Manager Assets to Workfront. Once linked, you can view and manage the content in Workfront, and any changes made to the content in Experience Manager Assets will be reflected in Workfront.

IMPORTANT

If your organization declines to sign the GenAI Rider agreement, you can still use Content Advisor to choose assets and folders in Experience Manager Assets, but you will not have access to AI-powered features such as AI Search, smart suggestions, or analyzing campaign briefs.

Access requirements

Expand to view access requirements for the functionality in this article.

Adobe Workfront package	Any
Adobe Workfront licenses	Contributor or higher Request or higher
Additional products	You must have Experience Manager as a Cloud Service, and you must be added to the product as a user in the Admin Console.
Experience Manager Permissions	You must have write access to the folder.
Access level configurations	Edit access to Documents

Object permissions	View access or higher
---------------------------	-----------------------

For more detail about the information in this table, see [Access requirements in Workfront documentation](#).

Prerequisites

Before you begin:

- Your Workfront Administrator must configure an Experience Manager integration. For more information, see [Use the Adobe Experience Manager with the Frame.io integration](#).
- To use Smart suggestions or Campaign Briefs functionality, you must sign a GenAI Rider. For more information, see [Use Content Advisor to access AEM content in Adobe applications](#).

Link content from Experience Manager Assets

To link content:

1. Go to the Workfront object where you want to link content.
2. Click the **Documents** section in the left panel.
3. Click **New** on the right side of the page, then click **Link from Experience Manager** to link an individual asset or **Link AEM Folders** to link a folder.
4. With Content Advisor, you can:

Search for assets using AI Search. Use AI-powered search that understands meaning and intent behind queries, supporting multiple languages, typos, and synonyms.	For more information, see AI Search for smarter asset discovery .
View smart suggestions based on context and intent. Discover assets that align with your content needs using context-aware recommendations from the host Adobe application.	For more information, see Smart suggestions based on context and intent .
Upload a campaign brief to discover relevant assets. Upload a PDF, DOCX, or TXT campaign brief document so Content Advisor can analyze it and recommend relevant assets.	For more information, see Campaign briefs to discover relevant assets .

View and select Dynamic Media asset renditions. Browse channel-optimized renditions including image presets, Smart Crops, and format types, and apply Dynamic Media modifiers to preview adjustments in real time.	For more information, see Dynamic Media asset renditions available for use .
Apply Dynamic Media modifiers to renditions. Add modifiers to transform asset renditions in real time and preview the results before selecting a rendition for your host application.	For more information, see Dynamic Media asset renditions available for use .
Discover and browse Content Fragments. Search through Content Fragments, view live thumbnail previews, check status (Draft, Modified, or Published), and inspect detailed properties, references, and variations.	For more information, see Discovery of Content Fragments .
Access asset metadata. Review asset properties such as title, description, format, size, and other metadata tabs (Product, Campaign, Tags) consistent with the Assets view.	For more information, see Access asset metadata consistent with Assets view .
Filter assets using predefined filters. Refine asset results using filters such as File Type, File Format, Asset Status, File Size, Image Width, Image Height, Modified Date, and Created Date.	For more information, see Access filters consistent with Assets view .
Save and reuse searches. Create saved searches by specifying a search term and filter options, then reuse them across Experience Manager Assets and other Adobe applications.	For more information, see Access and reuse recent and saved searches .
Search for assets across and within collections. Search for assets or collections across all collections, or limit your search to a specific collection.	For more information, see Search for assets across and within collections .

Link a new version from Experience Manager Assets

You can pull new content over from Experience Manager Assets and add it to an existing asset as a new version. If the document is already linked and a new version is added in Experience Manager Assets, the new version appears automatically in Workfront.

To link a new version:

1. Go to the Workfront object where you want to link content.
2. Click the **Documents** section in the left panel.
3. Select the asset you want to replace with a new version. You can't create a new version of an asset in a linked folder.

4. Select **Add New > Version**, then select the Experience Manager integration your administrator set up.

[!NOTE]

The Workfront administrator can choose any name for this integration, so it might not specifically mention Experience Manager Assets.

1. Select the content you want to link.
2. Click **Select**.

Link a folder from Experience Manager Assets

Permissions to view individual assets inside of a folder rely on Experience Manager Assets permissions.

To link a folder:

1. Go to the Workfront object where you want to link content.
2. Click the **Documents** section in the left panel.
3. Click **Assets > Files & Folders**.
4. Click the **Filter** icon, then in the **Asset Type** section, choose **Folders**.
5. Select the folder you want to link.
6. Click **Select**.

Considerations

- Review and approval workflows are not supported for linked assets. If you need to use a review and approval workflow, you must first download the asset from Experience Manager Assets and then upload it to Workfront.
- Metadata fields are first mapped when you send an asset from Workfront to Experience Manager Assets. If your Workfront administrator has enabled object metadata sync, fields remain up to date if they are changed in either application.
